NO EVIDENCE 0 / 3

Bachelor's degree

PARTIAL 1 / 3

WEIGHTED SCORE

62 / 100

Hold — one must-have has no evidence

Illustrative rows from the Northwind sample packet

Runs with no API key · audit export CSV and JSON · Vultr Cloud Compute + Serverless Inference

THE PROBLEM

Screening is where both fail

A fluent model invents a fit

Give it a bootcamp graduate and a payments role and it will find the match. It is optimising for a confident answer, not a defensible one.

The candidate advances on text they never wrote.

A tired recruiter overweights the wrong signal

A school name. A summary that reads young. A photo reference. None of it is evidence of the work the role needs.

The best-written resume wins, not the best-matched.

Neither leaves a record

The decision that moved someone forward cannot be read back - not by the candidate, not by the hiring manager, not by whoever must answer a challenge.

No audit trail means no way to fix the pattern.

The answer is not a better score. It is a narrower job for the model and a wider record for the human.

THE RULE

Silence scores zero

0 *contribution, every time, when the resume never says it.*

REQUIREMENT WEIGHTS

Must-have · 3
Responsibility · 2
Nice-to-have · 1

SUPPORTED

Enough keywords appear inside the cited lines, and a stated year count meets the bar when the job states one.

PARTIAL

Some wording is there, the year count is low or missing, or the only hit is a weak signal such as university with no degree type.

NO EVIDENCE

Nothing citable. The system does not guess from a job title, a date range or a school name.

2016 - 2024 is not treated as eight years. Only a stated count such as 8 years counts - and 54-year-old does not count either.

THE PIPELINE

What happens on every run

01 Rubric

A job description and up to 8 resumes go in. The rubric is written down before anyone is scored.

02 Evidence

Each requirement is searched inside each resume, line by line, not summarised.

03 Verify

The server keeps only a quote it can find as a substring of the resume. Fabricated lines are dropped.

04 Score

Weights, coverage and year counts produce the number and the ranking. No model owns this step.

05 Decide

Advance, hold or decline is a label. A person confirms or overrides, and an override needs a note.

Steps 02 to 04 run twice - once on the resume as written, once on a redacted copy - and the difference is the fairness flag. One live screening of 6 resumes is 13 inference calls.

PROOF IN THE DEMO

Two results that argue for it

THE FRONTEND CANDIDATE

A degree that was only a school name

Her Kubernetes and payments rows come back with no evidence. The degree row is only partial, and the single quote behind it is the string Stanford University. Redact the school and that requirement loses every citation.

Flagged: the point was never about the work

THE STAFF ENGINEER

54 years old, and the score does not move

Redaction removes his age, the father-of-three wording, the headshot reference and the Georgia Tech line. His score stays put, because the citations are the work itself: the ledger, the settlement jobs, the on-call rotation.

Under the 8-point bar: the evidence was the work

The claim is not that the tool is unbiased. It is that a school name can no longer pass as a qualification.

BLIND REVIEW

Same rubric, second pass, on a redacted copy

WHO THEY ARE

Identity

The candidate's name, email addresses, phone numbers and profile URLs.

HOW THEY ARE DESCRIBED

Gender cues

Gendered pronouns and titles, photo references and markdown images, and wording such as women or father of three.

WHERE THEY STUDIED

Credentials

University, college, institute, bootcamp and a short list of school abbreviations. Skill words that shared a sentence with a removed cue stay.

HOW OLD THEY SOUND

Age

Ages, born-in years and class-of years. Employment ranges such as 2019 - 2024 are not treated as age and are left alone.

Flag rule: an overall movement of 8 points or more, or any requirement that loses every citation after redaction. The threshold is configurable, and redaction is best-effort and shown, not silent.

BUSINESS VALUE

What a recruiting pod actually buys

WHERE THE TIME GOES

The first pass, not the decision

A recruiter reads every resume against the job by hand. This does that reading and shows its work; the shortlist stays a human call.

HOW YOU CHARGE

Per role or per seat

Not per candidate scored. A pod pays for the desk, which keeps the incentive away from rejection volume.

WHAT COMPLIANCE BUYS

A record you can read back

Recruitment and worker-management AI is a high-risk category under the EU AI Act. Every decision here is logged and exports as CSV or JSON.

THE ASK

One pod, two weeks

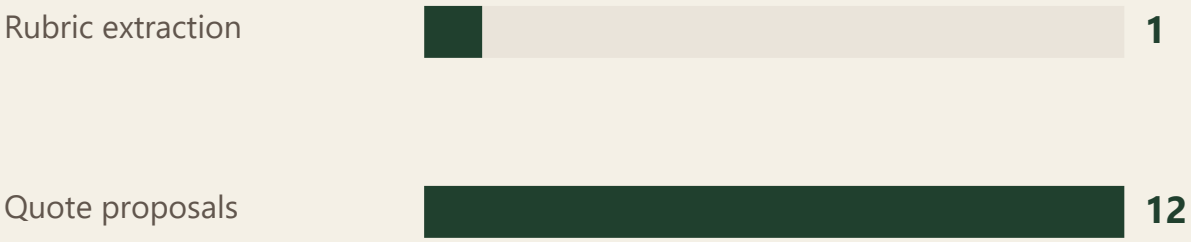

Success is an audit log a hiring manager can read and a fairness challenge you can answer - not a hidden rank.

No savings percentage, no adoption figure and no accuracy claim is made on these slides. The tool has not been deployed to a real recruiting team, and every resume in the sample packet is synthetic.

APPLICATION OF TECHNOLOGY

Where Vultr is, and where the model is not

13 inference calls per live screening

6 candidates, each scored twice - once on the resume as written and once on the redacted copy. Bar lengths are proportional to those counts.

THE TRUST BOUNDARY

The model may only propose requirement text and quotes.The server discards anything that is not a verbatim substring.The deterministic scorer owns the number.

ON VULTR

Cloud Compute runs the container on port 43123.Serverless Inference is reached through the OpenAI-compatible endpoint.The key lives in the server environment only - the browser never sends one.No GPU is used, which is why a small VM is enough.

Mock mode makes zero model calls. Live mode makes 13. The evidence search, scoring, redaction and audit logic are identical in both - which is what makes the mock a test, not a demo.

THE ASK

One recruiting pod, two weeks

Success is an audit log a hiring manager can read and a fairness challenge you can answer - not a hidden rank.

CODE

Public repository

Setup and deployment docs, MIT licensed, no secrets committed.

DEMO

Live URL on a Vultr VM

The container published from the VM, reachable in any browser.

NO KEY

Deterministic mock

Judges can run the whole product without an API key.

If it is not written down, it is not a point.
